Progress Actional Diagnostics is a complete web services testing solution that integrates seamlessly with WebSphere® Server and BizTalk®, allowing developers to test services without writing code. The diagnostic functionality of Progress Actional Diagnostics is designed to help you understand service behavior and identify problems throughout the lifecycle without the need to write code. It allows you to: Understand and follow process flows of services with real-time process visualization. Simulate failed communication with a failed service call or message exchange. Debug service-to-service integration with interdependency mapping. Find deadlocks and other problems with process interactions. Identify performance bottlenecks and where a service is calling back into itself. Validate quality and compliance of a service using pre-set testing strategies. Validate conformance of a service to known quality standards or specifications. Get instant feedback on a service's development quality by applying actions to production-like loads. Get instant feedback on a service's compliance to known quality standards or specifications. Save time and effort by eliminating the need to write tests or look for problems by following a process flow with visualization of a service's state and interactions. Improve your existing application and deployment approach by following an agile methodology with all of the required steps and capabilities. Progress Actional Diagnostics is a complete WebSphere® Server and BizTalk® middleware integration solution that can be deployed with your existing middleware as-is, or can be used with the BizTalk® Adapter Designer to integrate into your existing BizTalk® instance, or with the WebSphere® Adaptor Designer to integrate into your existing WebSphere® Server instance. Data-Driven Diagnostics Web services diagnostics is often driven by data. Even in the simplest example, a web service can access a relational database to obtain values to be used in a response or to be passed to another service. With server-to-server communication such data may be on a different service or process. To effectively diagnose such services, the diagnostics solution must follow the data so that service interactions can be correctly captured. In Progress Actional Diagnostics, data can be captured with a light-weight and unobtrusive agent that can monitor, log, and collect data. The agent provides data about the interactions of each service in the system. These data are used to diagnose and resolve problems at any phase of the lifecycle, from creation to production. Actional Diagnostics

- Facilitates the development and deployment of high-quality, well performing, compliant Web services, without the need for code.
- Accelerates problem diagnosis and resolution, service testing, compliance validation, and quality assurance, with easy-to-use tools for:
 - Code-free problem resolution through the ability to understand service behavior and identify problems throughout the lifecycle without the need to write code.
 - Validating performance, quality, and compliance to quickly and easily perform unit, functional, load, compliance, regression, and acceptance testing on services.
 - Deep visibility into service behavior and potential bottlenecks by being able to follow process flows and map interdependencies early in the lifecycle, when problems are easier to find and less costly to fix.
 - Enable advanced analytics and performance management, including reporting, alerts, and budgeting, which help you deploy services, track performance, and provide insights into potential risks.
- Enables both technical and business analysts to perform the required tasks, and to focus on the business problem that needs solving and on the value that the service brings.
- Supports simple to complex service scenarios and builds on existing Actional Diagnostics Crack For Windows-based services for performance monitoring,

health checks, service traceability, and system integration. • Provides a familiar, easy-to-use, and powerful interface that makes configuring, managing, and developing services quick and efficient. • Works on all major operating systems and browsers with no additional costs or time required for setup. Deploy Actional Diagnostics Enterprise Service on Cloud The Actional Diagnostics Enterprise Service on Cloud allows to run your services on a variety of cloud platforms and use the service monitoring capabilities to address issues in your service quickly and efficiently, and track performance, health, and events of your services over time. When web services are deployed for the first time, they need to be set up to work correctly with the network environment. This may require the use of a service proxy. If the service proxy is not properly configured or configured incorrectly, the service may not work correctly. A variety of web services fail to work properly in this situation. The Configuration Wizard in Actional Diagnostics can be used to setup and configure web services for use with a service proxy. The Configuration Wizard also has the ability to setup and configure a web service for use with a load balancer. This is a step by step tutorial for the Cisco Web Security Appliance (WSA) Enabling & configuring the WSA for SSL security. The Web Security Appliance (WSA) is a highly configurable Cisco device designed to enhance and extend the capabilities of the Cisco ASA-5505. The WSA can be integrated into the Cisco ASA-5505 to create a comprehensive web security infrastructure. In this module, the WSA SSL Configuration will be demonstrated through a step by step tutorial. The steps will show how to enable and configure SSL and how to use the Interactive Connectivity Evaluator to check for the validity of the SSL Certificate. The WSA is based on a Linux Platform with the following components. · Routing Engine · Application Manager (AM) · Virtual Application Platform (VAP) The WSA can be integrated into the Cisco ASA-5505 through either a network interface card (NIC) or the WSA Controller. This tutorial will configure the WSA using the WSA Controller in Integrated mode. The WSA can also be integrated with a new Cisco ASA-5505 that has a second 10 Gbit/s uplink. In this case, the WSA controller will connect directly to the second interface. The WSA has been enhanced to handle SSL/TSL sessions. This enables the ASA to handle SSL/TSL sessions and to serve SSL/TSL content. Please be aware that when you deploy an ASA using the WSA, the ASA will be deployed with a WSA and all ASA services that are running on the ASA will be available through the WSA. This means that when you configure WSA and the ASA in Integrated mode, then only the WSA services will be available for the ASA. The WSA provides the following services that are enhanced for SSL security. · Server ACL · HTTP proxy

Developing and deploying high-quality, well performing, compliant Web services is no easy task. The inherent complexities in a service lifecycle that involves frequent updates and shorter QA cycles, together with the challenges of working with distributed services that have interdependencies, can make development a long and arduous process. Progress Actional Diagnostics helps overcome those challenges by reducing the complexity of developing, testing and validating XML-based services, and by making unit testing and compliance checking accessible earlier in the lifecycle and easier to accomplish. Actional Diagnostics accelerates problem diagnosis and resolution, service testing, compliance validation, and quality assurance, with easy-to-use tools for: · Code-free problem resolution through the ability to understand service behavior and identify problems throughout the lifecycle without the need to write code. · Validating performance, quality, and compliance to quickly and easily perform unit, functional, load, compliance, regression, and acceptance testing on services. · Deep visibility into service behavior and potential bottlenecks by being able to follow process flows and map interdependencies early in the lifecycle, when problems are easier to find and less costly to fix.
